The invention relates to an isolated polynucleotide sequence or their complement encoding a polypeptide having a sequence at least 40% identical to DMT (DEMETER, previously known as ATROPOS (ATR)) Domain A, B or C or their combinations. Also included are an expression cassette comprising the polynucleotide or comprising a heterologous polynucleotide under the control of a promoter at least 70% identical to DMT 5' flanking sequence, DMT 3' flanking sequence or an 5' untranslated region of DMT, a host cell comprising an exogenous polynucleotide encoding a DMT-like protein and a transgentc plant comprising a polynucleotide encoding a DMT-like protein. The expression cassette is useful for modulating transcription. The method comprises introducing the cassette into a host cell preferably Agrobacterium by sexual cross, and selecting a host cell with modulated transcription, where the protein is capable of exhibiting at least one of the following biological activities, which include enhanced expression of the protein in a plant results in a delay in flowering time, introduction of the protein into a cell results in modulation of methylation of chromosomal DNA in the cell, reduction of expression of the protein in a plant results in endolation expression of the protein in a handle endosperm development and expressing of the protein in an Arabidopsis leaf results in expression of the MEDEA gene. The polynucleotide is useful for detecting a nucleic acid in a sample. The protein in a france to 5-methyllogicus and requilates
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    polynucleotide that control plant development comprising a sequence

Also included are an expression as casette comprising the polynucleotide or comprising a heterologous polynucleotide under the control of a promoter at least 70% identical to DMT & flanking sequence, DMT 3' flanking sequence or an 5' untranslated region of DMT, a host cell comprising an exogenous polynucleotide encoding a DMT-like protein and a transgenic plant comprising a cooling a DMT-like protein. The expression cassette is useful for modulating transcription. The method comprises introducing the cassette into a host cell preferably Agrobacterium by sexual cross, and selecting a host cell with modulated transcription, where the protein is capable of exhibiting at least one of the following biological activities, which include enhanced expression of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Ø

                                                                                                                                                                                                                                                                     Ω
                                                                                                                                                                                                                                                                                                                                                                                                                  ò
```

```
protein in a plant results in a delay in flowering time, introduction of the protein into a cell results in modulation of methylation of chromosomal DNA in the cell, reduction of expression of the protein in a plant results in enhanced endosperm development and expressing of the protein in an Arabidopsis leaf results in expression of the MEDEA gene. The polynucleotide is useful for detecting a nucleic acid in a sample. DEMETER is related to 5-methylcytosine glycosylases and regulates transcription of target genes by demethylation. The present sequence encodes a DMT-like protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            6409
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                6469

                                                                                          ŏ
                                                                                                                               g
                                                                                                                                                                                                                                                                                                                                                                    The invention relates to an isolated polynucleotide sequence or their complement encoding a polypeptide having a sequence at least 40% identical to DMT (DEMETER, previously known as ATROPOS (ATR)) Domain A, B or C or their combinations. Also included are an expression cassette comprising the polynucleotide or comprising a heterologous polynucleotide under the control of a prometer at least 70% identical to DMT 5' flanking sequence, DMT 3' flanking sequence or an 5' untranslated region of DMT, a host cell comprising an exogenous polynucleotide encoding a DMT-like protein. The expression cassette is polynucleotide encoding a DMT-like protein. The expression cassette is useful for modulating transcription. The method comprises introducing the cassette into a host cell preferably Agrobacterium by sexual cross, and selecting a host cell preferably Agrobacterium by sexual cross, and selecting a host cell with modulated transcription, where the protein is capable of exhibiting at least one of the following protein in a plant results in a delay in flowering time, introduction of the protein into a cell result in modulation of methylation of the protein in an arabidopsis leaf results in expression of the protein in a plant results is useful for detecting a nucleic acid in a sample. The polynucleotide is useful for detecting a nucleic acid in a sample. DEMETER is related to 5-methylcytosine glycosylases and regulates transcription of target genes by demethylation. The present
                                                                                                                                                                                                                                                                   New polynucleotide that control plant development comprising a sequence having a specific homology to DEMETER domains A,B or C

The polynucleotide is useful for detecting a nucleic acid in a sample. DEMETER is related to 5-methylcytosine glycosylases and regulates transcription of target genes by demethylation. The present sequence represents flanking DNA from the Arabidopsis DMT gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to an isolated polynucleotide sequence or their complement encoding a polypeptide having a sequence at least 40% identical to DMT (DEMETER, previously known as ATROPOS (ATR)) Domain A, Bor C or their combinations. Also included are an expression cassette comprising the polynucleotide or comprising a heterologous polynucleotide under the control of a promoter at least 70% identical to DMT 5′ flanking sequence, DMT 3′ flanking sequence or an 5′ untranslated region of DMT. A host cell comprising an exogenous polynucleotide encoding a DMT-like protein and a transgenic plant comprising a polynucleotide encoding a DMT-like protein. The expression cassette is useful for modulating transcription. The method comprises introducing the cassette into a host cell preferably Agrobacterium by sexual
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New polynucleotide that control plant development comprising a sequence having a specific homology to DEMETER domains A,B or \mathsf{C}
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Tatarinova TV;

Also included are an expression cassette comprising the polynucleotide or comprising a heterologous polynucleotide under the control of a promoter at least 70% identical to DMT 5' flanking sequence, DMT 3' flanking sequence or an 5' untranslated region of DMT, a host cell comprising an exogenous polynucleotide encoding a DMT-like protein and a transgenic plant comprising a polynucleotide encoding a DMT-like protein. The expression cassette is useful for modulating transcription. The method comprises introducing the cassette into a host cell preferably Agrobacterium by sexual

                     plant results in enhanced endosperm development and expressing of the protein in an Arabidopsis leaf results in expression of the MEDEA gene The polynucleotide is useful for detecting a nucleic acid in a sample. DEMETER is related to 5-methylcytosine glycosylases and regulates transcription of target genes by demethylation. The present sequence encodes a DMT-like protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                80

                                                                                                                                                                                                                                                                                                                                                                                                                                                  RESULT 2
148453
hypothetical protein T32M21.170 - Arabidopsis thaliana
C;Species: Arabidopsis thaliana (mouse-ear cress)
C;Species: 20-Apr-2000 #sequence_revision 20-Apr-2000 #text_change 20-Apr-2000
C;Accession: T48453
R;Bevan, M.; Terryn, N.; Ardiles, W.; Buysshaert, C.; Dasseville, R.; De Clerck, R.; Submitted to the Protein Sequence Database, March 2000
A;Reference number: 224487
A;Accession: T48453
A;Stetus: preliminary
A;Molecule type: DNA
A;Residues: 1-555 <BEV>
A;Cross-references: EMBL:AL162875
A;Experimental source: cultivar Columbia; BAC clone T32M21
